Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Tregulatory protein CD53.";

Tregulatory protein CD53.";

Structure of a soluble, glycosylated form of the human complement regulatory protein CD53.";

Structure 2.185-199 (1994).

Structure 2.185-199 (1994).

- I- FUNCTION: Potent inhibitor of the complement membrane attack complex (MAC) action. Acts by binding to the CB and/or C9 complements of the assembling MAC, thereby preventing incorporation of the multiple copies of C9 required for complete formation of the camolytic pore. This inhibitor appears to be species-specific. Involved in signal transduction for T-cell activation complexed to a protein tyrosine kinase. Interacts with T-cell surface antigen CD2.

--- SUBCELLULAR LOCATION' Attached to the membrane by a GPI-anchor.

---- PPW: N- and O-glycosylated. The N-gycosylation mainly consists of a family of bi-antennary complex-type structures with and without predominant O-glycans are mono-sialylated forms of the disaccharide, Gal-beta-1,3GalNAc, and their sites of attachment are probably on Thr-77.

---- PPW: Glycated Glycation is found in diabetic subjects, but only at minimal levels in nondiabetic subjects Glycated CD59 lacks which the complex of the disaccharidate of subjects of disactions of signal complexes of a complexed CD5 and the complexed CD59 lacks which the complexed CD59 lacks which the complexed CD59 lacks which complexes to vascular complications of disactions of complexed CD59 lacks which co

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Zhao X.-J., Zhao J., Zhou Q., Sims P.J.;
Identity of the residues responsible for the species-restricted complement inhibitory function of human CD59.";
J. Biol. Chem. 273:10665-10671 (1998).
-!- FUNCTION: Potent inhibitor of the complement membrane attack complex (MAC) action. Acts by binding to the C8 and/or C9 complements of the assembling MAC, thereby preventing incorporation of the multiple copies of C9 required for complete formation of the osmolytic pore.
--- SUBCELULAR LOCATION: Attached to the membrane by a GPI-anchor (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MISCELLANEOUS: The mature form of this CD59 contains an additional serine residue before the conserved N-terminal leucine residue found in all other CD59 homologs sequenced to date.
SIMILARITY: Contains 1 UPAR/Ly6 domain.

Lipid-raft targeted derivative of a soluble polypeptide e.g. a soluble complement regulatory molecule for treating disorders involving complement activity and various inflammatory, neurological and immune disorders.

Example 2; Page 44; 51pp; English.

The invention relates to a soluble derivative (I) of a soluble polypeptide. (I) has two or more heterologous membrane binding elements with low membrane affinity covalently associated with the polypeptide, the elements being capable of interacting with components of cellular or artificial membranes exposed to extracellular fluids and target lipid raft components of membrane. (I) is useful for treating disorders

```
therapeutic agent, and for the preparation of a medicament for treatment to disorders and for the preparation of a medicament for treatment of disorders involving complement activity and various inflammatory and immune disorders. (I) is useful for treating neurological disorders (e.g. multiple solerosis, stroke, Parkinson's, Alzheimer's disease, traumatic brain injury and allergic encephalitis), disorders of inappropriate or undesirable complement activation (e.g. xenograft rejection, corneal graft rejection), inflammatory disorders (including ulcerative colitis, Crohn's disease, uveitis, psoriasis, asthma, scleroderma, acute pancreatits), post-isohaemic reperfusion conditions (e.g. myocardial infarction, hypertension, renal ischaemia, restenosis, atherosclerosis), infarctious diseases or sepsis (e.g. rheumatoid arthritis, systemic lupus erythematosus, haemolytic anemia, glomerulonephritis, and myssthemia
                                                                                                                                                                                                                                                                                                                                                                                                                                     gravis), reproductive disorders (antibody- or complement-mediated infertility), and wound healing. The present sequence represents the amino acid sequence of APT634, used in the synthesis of a lipid raft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              100.0%; Score 96; DB 5; Length 70; 100.0%; Pred. Lipid-raft targeted derivative of a soluble polypeptide e.g. a soluble complement regulatory molecule for treating disorders involving complement activity and various inflammatory, neurological and immune

Example 7; Page 45; 51pp; English.

The invention relates to a soluble derivative (I) of a soluble polypeptide. (I) has two or more heterologous membrane binding elements with low membrane affinity covalently associated with the polypeptide,

the elements being capable of interacting with components of cellular or artificial membranes exposed to extracellular fluids and target lipid caft components of membrane. (I) is useful for treating disorders components of membrane. (I) is useful for treating disorders not the peptide fragment of CDS9, DAF or other the reapeutic agent, and for the preparation of a medicament for treatment of disorders involving complement activity and various inflammatory and immune disorders. (I) is useful for treating neurological disorders (e.g. multiple sclerosis, stroke, Parkinson's, Alzheimer's disease, traumatic complement activation (e.g. xenograft rejection, corneal complement activation (e.g. xenograft rejection, corneal crops disease, uveitis, psoriasis, asthma, scleroderama, acute pancreatitis), post-ischaemic repetfusion conditions (e.g. myocardial infarction, Mypertension, renal ischaemia, restenosis, atherosclerosis), infections diseases or sepsis (e.g. multiple organ failure, septic complement diseases (e.g. rheumatoid arthritis, systemic lupus erychematosus, haemolytic anemia, alomenulomephritis and myasthenia gravis), reproductive disorders (antibody- or complement-mediated infartility), and wound healing. The present sequence represents APT2061 which comprises soluble human CDSand a C-terminal oysteine residue, recombinantly expressed in chinese hamster ovary cells ö Compounds modulating CD59 mediated complement activity, for treatment of, e.g. immunovasculitis. The invention relates to compounds modulating CD59 mediated complement activity. It provides (i) molecules structurally mimicking human CD59 amino acid residues 42-58 (region which serves as binding site for CD59 Gaps CD59 mediated complement; human; Cd59 protein; C9 protein; mimetic; tumour therapy; complement-mediated inflammation; immune disorder; immunovasculitis; rheumatoid arthritis; scleroderma; C5b-9 complex; ö Score 96; DB 5; Length 71; Pred. ```
c9 interactions) when they are in a spatial orientation which can inhibit the formation of the human C5b-9 complex. These mimetics specifically bind to amino acid residues 359-384 of human C9. (ii) molecules structurally mimicking C9 amino acids 359-384 when they are in a spatial orientation which can promote the formation of the C5b-9 complex. Compounds that mimic CD59 can be used to increase CD59 inhibition of C5b-9 complex assembly. This is especially useful in patients in need of suppression of complement-mediated inflammation, e.g. immune disorders and diseases such as immunovasculitis, rheumatoid arthritis, scleroderma. Compounds that mimic C9 can be used to promote C5b-9 complex assembly. This is useful in patients in need of complement activation. The composition can be administered as an adjunct to tumour therapy. The present sequence represents a human CD59 (a plasma membrane antigen)
                                                                                                                                                                                                                                                                                                                                                                                                                              protein fragment

polypeptide. (I) has two or more heterologous membrane binding elements

with low membrane affinity covalently associated with the polypeptide, the elements being capable of interacting with components of cellular or artificial membranes exposed to extracellular fluids and target lipid raft components of membrane. (I) is useful for treating disorders amenable to treatment by a soluble peptide fragment of CD59, DAF or other the presparation of a medicament for treatment of disorders involving complement activity and various inflammatory and immune disorders. (I) is useful for treating neurological disorders (e.g. multiple sclerosis, stroke, parkinson's Alzheimer's disease, traumatic brain injury and allergic encephalitis) (disorders of inappropriate or undesirable complement activation (e.g. xenograft rejection, corneal complement activation (e.g. xenograft rejection, corneal complement activation (e.g. xenograft rejection, conneal complement activation (e.g. xenograft rejection, conneal complement activation (e.g. xenograft rejection, contitie, psoriasis, asthma, scleroderma, acute crown site of parcreatitis), post-ischaemic reperfusion conditions (e.g. myocardial infarction, hypertension, renal ischaemia, restenosis, atherosclerosis), infarction, hypertension, renal ischaemia, restenosis, atherosclerosis), infarction, hypertension, renal ischaemia, restenosis, atherosclerosis, confidentions diseases or sepsis (e.g. rheumatoid arthritis, systemic lupus continued isceases (e.g. rheumatoid arthritis, systemic lupus continued isceases (e.g. rheumatoid arthritis, and mysathemia

gravis), reproductive disorders (antibody- or complement-mediated infertility), and wound healing. The present sequence represents API which comprises coluble human CD59and a C-terminal cysteine residue, recombinantly expressed in B. coli

The invention (1) has two or more heterologous membrane binding elements with low membrane affinity covalently associated with the polypeptide, the elements being capable of interacting with components of cellular or artificial membranes exposed to extracellular fluids and target lipid cartificial membranes exposed to extracellular fluids and target lipid cartificial membrane by a soluble peptide fragment of CDS<sub>9</sub>. DAF or other components of membrane by a soluble peptide fragment of CDS<sub>9</sub>. DAF or other therapeutic agent, and for the preparation of a medicament for treatment of therapeutic agent, and for the preparation of a medicament for treatment of disorders involving complement activity and various inflammatory and immune disorders (1) is useful for treating neurological disorders (e.g. multiple sclerosis, stroke, Parkinson's, Alzheimer's disease, traumatic brain injury and allergic encephalitis), disorders of inappropriate or undesirable complement activation (e.g. xenograft rejection, corneal graft rejection), inflammatory disorders (including ulcerative colitis, Crohn's disease, uveitis, psoriasis, asthma, scleroderma, acute crohn's disease, uveitis, psoriasis, asthma, restenosis, atherosclerosis), infarctions diseases or sepsis (e.g. multiple organ failure, septic shock), autoimmune diseases (e.g. multiple organ failure, septic shock), autoimmune diseases (e.g. multiple organ failure, septic cromplementatosus, haemolytic anemia, glomerulomephritis and mysathenia cravis), reproductive disorders (e.g. rheumatoid arthritis, systemic lupus crythematosus, and wound healing. The present sequence represents the

The invention relates to a soluble derivative (I) of a soluble polypeptide. (I) has two or more heterologous membrane binding elements of polypeptide. (I) has two or more heterologous membrane bindings capable of interacting with components of cellular or artificial membranes exposed to extracellular fluids and target lipid cartificial membranes of membrane. (I) is useful for treating disorders amenable to treatment by a soluble peptide fragment of CDS9. DAF or other the preparation of a medicament for treatment of disorders involving complement activity and various inflammatory and immune disorders. (I) is useful for treating neurological disorders (e.g. multiple sclerosis, stroke, Parkinson's, Alzheiner's disease, traumatic brain injury and allergic encephalitis), disorders of inappropriate or undesirable complement activation (e.g. xenograft rejection, corneal graft rejection), inflammatory disorders (including ulcerative colitis, Crohn's diseases or sepsis, sethma, scleroderma, acute pancreatitis), post-isfolemic reperfusion conditions (e.g. myocardial infarction, hypertension, renal ischemic restenois, atherosclerosis), infarctions diseases or sepsis (e.g. multiple organ failure, septic shock), autoimmune diseases (e.g. multiple organ failure, septic shock), autoimmune diseases (e.g. rheumatoid arthritis, systemic lupus erythematosus, haemolytic anemia, glomerulonephritis and myasthenia gravis), infaritity), and wound healing. The present sequence represents the

The present sequence is the human membrane attack complex inhibitory factor (MACIF) mutant Asn18Gln (residues 1-77), which inhibits complement mediated cytolysis, and the release of FG12 and basic fibroblast growth factor (bFGF) by complement. It can be used to suppress transplanted organ rejection, especially hyperacute transplant rejection, and the nonlethal effects of complement, e.g. inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modified human membrane attack complex inhibitory factor - has glutamine at position 18 and is an antiinflammatory and complement blocker, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                lymphocyte; surface antigen; autoimmune disease; cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a soluble derivative (I) of a soluble pulpaperide. (I) has two or more heterologous membrane binding elements with Lub polypeptide. (I) has two or more heterologous membrane binding elements to be a soluble be a soluble being capable of interacting with components of cellular or artificial membranes exposed to extracellular fluids and target lipid raft components of membrane. (I) is useful for treating disorders of membrane by a soluble peptide fragment of CD59, DAF or other therapeutic agent, and for the preparation of a medicament for treatment of disorders involving complement activity and various inflammatory and immunity and allergic encephalitis), disorders of inappropriate or multiple sclerosis, stroke, Parkinson's, Alzheimer's disease, traumatic brain injury and allergic encephalitis), disorders of inappropriate or undeablabilable complement activation (e.g. xenograft rejection, corneal graft rejection), inflammatory disorders (including ulcerative colitis, Crohn's disease, uveitis, poortiasis, asthma, scleroderma, acute contents and c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         infarction, hypertension, renal ischaemia, restenosis, atherosclerosis), infectious diseases or sepsis (e.g. multiple organ failure, septic shock), autoimmune diseases (e.g. rheumatoid arthritis, systemic lupus erythematosus, haemolytic anemia, glomerulonephritis and myasthenia gravis), reproductive disorders (antibody- or complement-mediated infertility), and wound healing. The present sequence represents the

                                                                                                                                                                                     à
                                                                                                                                                                                                                                                           ö
                                                                                                              This protein is similar to the murine lymphocyte antigen Ly 6. Antibodies raised against the antigen can be used in formulations for the treatment of autoimmune diseases, cancer and infections. The corresponding nucleotide sequence does not include an initial Leu codon. See also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The inventors claim a cell which contains a gene sequence which encodes protein CDS9.CDS9 is expressed by the cell and CDS9 inhibits complement mediated attack of the cell. The cells fail to elicit T lymphocyte mediated attack or are resistant to complement mediated attack. They can be used to treat patients with immune disorders. (Updated on 25-MAR-2003 to correct PN field.)
                                        Surface antigen of human lymphocyte - for use in study of human immune system of 101 residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Genetically engineered mammalian cell for treatment of coronary artery disease - inhibits complement-mediated attack and does not express surface proteins encoded by class I or II major histocompatability
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bothwell ALM, Elliot EA, Flavell RA, Madri J, Rollins S;

The present sequence is a polypeptide encoded by one of a large number of 5' ESTB derived from RNAs encoding secreted proteins. The 5' ESTB were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mENA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTB are not well suited for isolating cDNA perimed cDNA libraries. Such ESTB are not well suited for isolating cDNA included. S' ESTB are derived from mENAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTB are derived from mENAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. S' ESTB are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          expressed sequence tag; secreted protein; cDNA isolation;
(by SDS-PAGE) with a phosphatidylinositol (PI) anchor at position 76 (Glu) at the C-terminus. When the gene encoding MACIF is expressed in bacteria, the gene (see AAQ98521) gives a modified human MACIF protein comprising 128 amino acid residues (AAR80240); the PI anchor attachment does not occur in that case. The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences fortived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can threfore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forenist, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                      expressed sequence tag; secreted protein; cDNA isolation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antiinflammatory; dermatological; immunosuppressive; antiarthritic; antirheumatic; vasotropic; antidiabetic; neuroprotective; antiallergic; antiviral.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             complement system; immunoconjugate; cancer; Hodgkin's lymphoma; myeloid leukaemia; hypoxic tumour; viral infection; inflammatory condition; rheumatoid arthritis; Crohn's disease; systemic lupus erythematosus; cytostatic; antiasthmatic; antiantimatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                        Human, S' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to compounds modulating CD59 mediated complement activity. It provides (i) molecules structurally mimicking human CD59 anino acid residues 42-58 (region which serves as binding site for CD59 - C9 interactions) when they are in a spatial orientation which can inhibit the formation of the human C50-9 complex. These mimetics specifically bind to amino acid residues 359-384 of human C9. (ii) molecules exructurally mimicking C9 amino acids 359-384 when they are in a spatial crientation which can promote the formation of the C50-9 complex. Compounds that mimic CD59 can be used to increase CD59 inhibition of C50-0 complex assembly. This is especially useful in patients in need of suppression of complement-mediated inflammation, e.g. immune disorders and diseases such as immunovasculitis, rheumatoid arthritis, scleroderma. C0 compounds that mimic C9 can be used to promote C50-9 complex assembly. The composition can be administered as an adjunct to tumour therapy. The present sequence represents a human CD59 (a plasma membrane antigen)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human 1F5 antigen; immunodiagnosis; pernicious anaemia;
rheumatoid arthritis; systemic lupus erythematosus; glomerular nephritis.
                                                                                                                                                                                                                                                       Compounds modulating CD59 mediated complement activity, for treatment of, e.g. immunovasculitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઢ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to novel targeted modulators of the complement receptor 2 (CR2) protein that is involved in regulating complement acceptor 2 (CR2) protein that is involved in regulating complement acceptor 2 (CR2) proteins that acceptor that has a complement inhibitor linked to the CR2, which can be used modulate the complement system i.e. the series of blood proteins that are major effectors of the immune system. The present invention describes compositions that can be used to treat various cancers including Hodgkin lymphoma, myeloid leukaemia and hypoxic tumours, viral infections such as herpes simplex virus, cytomegalovirus and paptein. Barr virus, as well as inflammatory conditions for example rheumatoid arthritis, Crohn's disease and systemic lupus erythematosus. Accordingly, these compositions exhibit cytostatic, antiasthmatic, antihiflammatory, dermatological, immunosuppressive, antiasthmatic, antihidemmatic, vasotropic, antidiabetic, neuroprotective, antiallergic, antihider and antiviral activities. This polypeptide sequence is the human complement inhibitor CD59 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô

                                                                                                                                                  the cell membrane fraction number of princytes which are configurating the cell membrane fraction suspended overnight in buffer config. 1% noty1-beta-D-glucopyranoside (NOG). After centrifugation, the supernatur is treated with solid (NH4)2SO4 to 60% satu. After centrifugation the paper. Is dissolved in buffer contg. 0.1%NOG, then dialysed overnight against the same plus 0.15 M NaCl. 1F5 antigen is a glycoprotein with a mol. wt. of 20-25 kD. It contains N-glycoside type carbohydrate chain and phosphatidylinositol. It inhibits complement-mediated cell membrane damage. It may be used to generate polyclonal or monoclonal antibodies (Abs) which may be used to determinine the presence of 1F5 antigen on the surface of erythrocytes, lymphocytes or other cells, thus enabling the systemic lupus erythematosus and glomerular nephritis. It may be used to treat disorders in which complement activation is involved. Abs to it may be used in targeting therapy, such as cancer cell lysis, or alimination of malignant cells. Residues 27-70 are encoded by a cDNA fragment of the gene which encodes 1F5 antigen prepad. by the polymerase chain reaction (in AAN93318). (Updated on 25-MAR-2003 to correct FR field.)

The product may be useful in the study and development of drugs for the treatment of autoimmune diseases and cancer. Probes may also be developed for the isolation of other gene families
                                                                                                                                                          Gene product may be expressed in large quantities and pure form from CHC cells, useful for inhibiting the activity of late complement components ie. haemolysis resulting from MAC formation. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Surface antigen of human lymphocyte - and gene and antibody useful for investigation and treatment of auto:immune disease, cancer, infection,

Naturally occuring human MACIF is a glycoprotein of mol. wt. 18 +/- 1 kba (by SDS-PAGE) with a phosphatidylinositol (PI) anchor at position 76 (Glu) at the C-terminus When the gene encoding MACIF is expressed in bacteria, the gene (see AAQ98532) gives a modified human MACIF protein comprising 128 amino acid residues (AAR80240); the PI anchor attachment field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptide with human membrane attack complex inhibition factor activity also DNA and expression vectors used to regulate the complement system in the final stage of complement activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human membrane attack complex inhibition factor (MACIF) regulates the

Human CD59 (AAR86315) is a terminal complement inhibitor protein (CIP) that includes a C-terminal region involved in directing attachment of a glycosyl-phosphatidylinositol (GPI) anchor. A chimeric transmembrane terminal CIP (TWTCIP) comprising amino acids 1-77 of mature CD59 (i.e. lacking the GPI anchor region) and the transmembrane domain (amino acids expressed on the cell surfaces of the organs of transgenic animals. Such transgenic organs are protected from human complement attack upon
Terminal complement inhibitor chimeric protein and nucleic acid - esp against human complement, useful for protecting cells from complement attack e.g. in organ transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 128;

The sequence represents human CDS9 protein which is fused to human or porcine CTLA4 protein to form CTLA4-CDS9 chimeric protein. Chimeric proteins comprising a domain having CSb-9 and/or C3 inhibitory activity (e.g. CTLA4) and a domain having CSb-9 and/or C3 inhibitory activity (e.g. CTLA4) and a domain having T-cell inhibitory activity (e.g. CDS9) are capable of inhibiting both cellular immune responses and humoral immune responses. These polypeptides and their associated nucleic acids are useful for protecting pig cells of tissues and organs from both humoral and cellular rejection after xenotransplantation into humans. The sequences are capable of conferring resistance to humoral and cellular mechanisms of immune attack, to protect against human serum complement and to inhibit T-cell activation. Transgenic animals (for example, rodents, e.g. mouse, rati lagomorpha, e.g. rabbit, hare; and ungulates, e.g. pig, gat, sheep) expressing such a chimeric protein on the surfaces of their cells would have a higher chance of survival
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Chimeric protein useful for protecting xenotransplanted tissues by inhibiting cellular both humoral and immune responses, comprises a C5b-9 and/or C3 inhibitory domain, and a T-cell inhibitory domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            C5b-9 protein. Claimed refroviral vector particles express a complement inhibitor such as CD59, and are thereby protected from inactivation upon exposure to body fluids containing complement. Also claimed are: (1) a producer cell producing the vector particle; and (2) a chimeric retroviral envelope protein (see also AAW26325) with at least part of the N-terminal receptor- binding domain removed and replaced by a protein domain having a complement inhibitor activity. The vector is used in a claimed method for transducing cells in the presence of a body fluid containing complement, preferably ex vivo, especially for gene therapy, e.g. of hereditary or acquired blood disorders by transduction of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Retroviral vector particle expressing complement inhibitor activity - for transducing cells in body fluids containing complement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This protein sequence comprises human CD59, an inhibitor of complement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```

```
The invention relates to a chimaeric protein comprising a first domain capable of inhibiting a cellular immune response and a second domain capable of inhibiting a humoral immune response. Also included are a chimaeric DNA construct (comprising a DNA sequence encoding a domain capable of inhibiting a bumoral immune response and a DNA sequence concerns of inhibiting a humoral immune response), a cloning vector comprising the DNA construct, a host cell transformed by the vector, a transgenic cell, tissue, organ or mammal comprising the chimaeric protein, producing a mammal, mammalian organ, tissue or cells, where the mammal is useful as an organ donor for a human or organ, tissue or cells chimaeric protein defined above into the mammal, organ, tissue or cells, where the protein defined above into the mammal, organ, tissue or cells, defined regions of the DNA appearing as ADASOO35 which encodes the pig CTLA4 (cytotoxic T lymphocyte A4, also known as CD152) and defined cefined cell after xenotransplantation into a human, and in inhibiting humoral and cellular immune response cells in a cregion, and human CD52 (humoral response region), and of CTLA4 and human cregions of cregions of the protein response region), and of CTLA4 and human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   region) and human CD59 (humoral response region), and of CTLA.
DAF (not defined). The present sequence represents human CD59

New binding domain-immunoglobulin fusion protein, useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, Grave's disease or autoimmune disease.

Disclosure; SEQ ID NO 109; 157pp; English.

comprising a binding domain polypeptide that is fused to an immunoglobulin hinge region polypeptide, an immunoglobulin heavy chain CH2 constant region polypeptide that is fused to the hinge region polypeptide, and an immunoglobulin heavy chain CH3 constant region polypeptide, and an immunoglobulin heavy chain CH3 constant region polypeptide that is fused to the CH2 constant region polypeptide comprises: a wild-type human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues; where the mutated human IgG1 immunoglobulin hinge region polypeptide derived from (a) having 3 or more cysteine residues; where the first cysteine is not mutated; a mutated human IgG1 immunoglobulin hinge region polypeptide contains 2 cysteine residues, where the mutated human IgG1 immunoglobulin hinge region polypeptide contains no more than one cysteine residue; and a mutated human IgG1 immunoglobulin hinge region polypeptide contains no more than one polypeptide, derived from (a) having 3 or more cysteine residues; where the mutated human IgG1 immunoglobulin hinge region polypeptide contains no cysteine residues; where the mutated human IgG1 immunoglobulin hinge region polypeptide contains no cysteine residues. The binding domain-immunoglobulin fusion protein is capable of at least one immunological activity comprising antibody capable of at least one immunological activity comprising antibody dependent cell-mediated cytotoxicity (ADCC) and complement fixation. The binding domain polypeptide is capable of specifically binding to an entire comprising the polymuclectide (operably linked to a promoter), a host cell transformed or transfected with a recombinant expression construct, producing the binding domain-immunoglobulin fusion protein, a paramaceutical composition comprising the binding domain-immunoglobulin fusion protein, a pharmaceutical composition comprising the binding domain-immunoglobulin fusion protein or polymuclectide and a carrier, and treating a subject having or suspected of having a malignant condition or a B-cell disorder. The binding domain-immunoglobulin fusion protein is useful for treating a subject having or suspected of having a malignant condition or a B-cell disorder, cig. melanoma, carcinoma or sarcoma, rheumatoid arthritis, multiple sclerosis or autoimmune disease. The present sequence is a binding domain The invention relates to a binding domain-immunoglobulin fusion protein

```
The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the
                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
-immunoglobulin fusion protein-associated protein sequence. Note: The sequence data for this patent formed part of the printed specification and is also available in electronic format directly from USPTO at sequence.html?DocID=20030118592. The authors have not identified the sequences in the printed specification by their SEQ ID number therefore none of the sequences can be explicitly identified.

               pain and a pharmaceutical composition comprising the one or more polypeptides or their antibodies. The polymuclectide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       polypeptides, useful for

that increases or decreases the expression of the polymoleotide sequence that increases or decreases the expression of the polymoleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the activity of one or more of the compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polympetides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polympetides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene the sequence presented is a human protein (shown in Table 2 of the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polymeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polymeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating opin (e.g. spinal segmental nerve injury (Ctu) and spared nerve injury (Ctu) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at

                                                                                   for therapeutic intervention in treating adjease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial encephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRE) or cancer. Accordingly, these

The invention relates to a chimeric protein capable of inhibiting both cellular and humoral immune responses. The protein and DNA molecules are useful in the prevention or treatment of humoral and cellular rejection of xenotransplants. In particular, the DNAs may be used to produce

New chimeric protein capable of inhibiting both cellular and humoral immune responses, and DNA constructs encoding the chimeric protein, useful for preventing and/or treating rejection of xenotransplants.

This invention relates to a method of differentially modulating the composition of blood endothelial cells (BEC) or lymphatic condothelial cells with a composition comprising an agent that differentially modulates blood or composition comprising an agent that differentially modulates blood or lymphatic endothelial cells. Treating hereditary lymphoedema comprises and entity a muteration in at correlates with lymphoedema and with a muteration in at least one allele of a gene encoding a LEC protein, where the mutation correlates with lymphoedema in human subjects, and with the proviso that composition comprising a lymphatic growth agent selected from VEGF-C or VEGF-D polypeptides and polymucleotides. The invention may be useful for the development of compounds with an antiangingenic, cytosteric, vasotropic or antininflammatory activity or for gene therapy. The method is useful in modulating the growth or differentiation of blood is useful in modulating the growth or differentiation of blood or an endothelial cells or lymphatic endothelial cells, in treating hereditary currently or for gene therapy. The method of a drug on endothelial cells. The agent is useful in manufacturing a medicament for the differential modulation of blood vessel endothelial cells or lymphatic vessel endothelial cell growth or differentiation. The lymphatic growth agent may also be used in manufacturing a medicament for lymphatic growth agent may also be used in manufacturing a medicament for
                                                                                                                                                                                                  ö
transgenic animals for use as tissue/organ donors, the cells of which are protected from human cellular immune responses due to their expression of the chimeric protein. The present sequence represents the amino acid sequence of human CD59.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          lymphatic endothelial cell; LEC; hereditary lymphoedema; VEGFR-3; lymphatic growth agent; VEGF-C; VEGF-D; antianglogenic; cytostatic; vasotropic; antiinflammatory; gene therapy; endothelial cell disorder; inflammatory disease; cancer metestasis; lymphatic system; human.

LEC gene or of other diseases involving the lymphatic vessels, such as various inflammatory diseases and cancer metastasis via the lymphatic system. The present sequence is that of a human LEC/BEC differentially expressed protein which is related to the method of the invention. Note: This sequence does not appear in the specification but was obtained by the indexer using the source data given in table 14 of the specification.

New PRO polypeptides and polynucleotides, useful for treating e.g. erythematosus, rheumatoid arthritis, diabetes mellitus, immune-mediated renal disease, or demyelinating diseases of the central or peripheral nervous system

Claim 7; SEQ ID NO 178; 2940pp; English.

antiathmatic, antiathmatic, and respiratory activity. A polymorlection of the invention may have a use in gene therapy. The PRO polypetide, its agonist, antagonist, or antibody that specifically binds to the expensive antagonist, or antibody that specifically binds to the polypeptide is useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, usunding arthritis, a spondyloarthropathy, systemic sclerosis, an idiopathic inflammatory myopathy, Sjogren's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopenia, thyroiditis, diabetes mealitus, immune—mediated renal disease, a demyelinating disease of the central or peripheral nervous system, idiopathic demyelinating polyneuropathy, Guillain-Barre syndrome, The invention relates to a novel isolated nucleic acid and the PRO polypopetide encoded by it. A procein of the invention has antiinflammatory, antiarthritic, antitheumatic, immunosuppressive, osteopathic, antidiabetic, dermatological, antipsoriatic, antiallergic,

A polynucleotide of the invention may have a use in gene therapy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Schmidt JP, Wright RJ, Bruns CM, Marjanovic MM, Shen F;

with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, dastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or gene therapy. The present sequence represents a dithp protein of the invention. Note: The sequence date for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polynucleotides, useful for expressing recombinant proteins for analysis, characterization or therapeutic use, or as markers for tissues in which the corresponding protein is preferentially expressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises the amino acid and coding sequences of novel proteins. The DNA and protein sequences of the invention are useful as: markers for tissues in which the corresponding protein is preferentially expressed; as molecular weight markers on gels; as chromosome markers or tags; to identify chromosomes or to map related gene positions; and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                , Wang J;

Chimeric proteins comprising a domain having C5b-9 and/or C3 inhibitory activity (e.g. CTLA4) and a domain having T-cell inhibitory activity (e.g. CD59) are capable of inhibiting both cellular immune responses and humoral immune responses. These polypeptides and their associated nucleic acids are useful for protecting pig cells of tissues and organs from both humoral and callular rejection after xenotransplantation into humans. The sequences are capable of conferring reaststance to humoral and callular mechanisms of immune attack, to protect against human serum complement and to inhibit recall activation. Transgenic animals (for example, rodents, e.g. mouse,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 rat; lagomorphs, e.g. rabbit, hare; and ungulates, e.g. pig, goat, sheep) expressing such a chimeric protein on the surfaces of their cells would have a higher chance of survival
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  C2p-9

cTLA4 (cytotoxic T lymphocyte A4, also known as CD152) and defined regions of the CTLA4 protein ADA50037. The chimaeric protein is useful in the protection of the porcine cell after xenotrangplantation into a human, and in inhibiting humoral and cellular defence mechanism. Chimaeras were produced comprising pig CTLA4 (cellular immune response region) and human CD59 (humoral response region), and of CTLA4 and human DAF (not defined). The present sequence represents a CTLA4/CD59 chimaera
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a chimeric protein capable of inhibiting both cellular and humoral immune responses. The protein and DNA molecules are useful in the prevention or treatment of humoral and cellular rejection of xenotransplants. In particular, the DNAs may be used to produce transgenic animals for use as tissue/organ donors, the cells of which are protected from human cellular immune responses due to their expression of the chimeric protein. The present sequence represents the amino acid sequence of human CTLAA-CD59.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CTLA4; human; CD59; immune response inhibitor; xenotransplant rejection; transgenic; tissue donor; organ donor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The sequence represents a CTLA4-CD59 chimeric protein, formed from porcine CTLA4 protein and human CD59 protein. Chimeric proteins comprising a domain having CSb-9 and/Or C3 inhibitory activity (e.g. CTLA4) and a domain having T-cell inhibitory activity (e.g. CD59) are capable of inhibiting both cellular immune responses and humoral immune responses. These polypeptides and their associated nucleic acids are useful for protecting pig cells of tissues and organs from both humoral and cellular rejection after xenotransplantation into humans. The sequences are capable of conferring resistance to humoral and cellular mechanisms of immune attack, to protect against human serum complement and to inhibit T-cell activation. Transgenic animals (for example, rodents, e.g. mouse, rat; lagomorphs, e.g. rabbit, hare; and ungulates, control protein animals (for example, rodents, e.g. pig, goat, sheep) expressing such a chimeric protein on the surfaces of their cells would have a higher chance of survival. (Updated on 11-SEP -2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Chimeric protein useful for protecting xenotransplanted tissues by inhibiting cellular both humoral and immune responses, comprises a C5b-9 and/or C3 inhibitory domain, and a T-cell inhibitory domain.
                                                                                                                                                                                                                                                                         CTLA4; CD59; human; pig; T-cell activation; C5b-9 inhibitory activity; C3 inhibitory activity; cellular immune response; xenotransplantation; humoral immune response; human serum complement; rodent; mouse; rabbit; rat; lagomorph; hare; ungulate; goat; sheep; mutant; mutein.

```
The invention relates to a chimaeric protein comprising a first domain capable of inhibiting a cellular immune response and a second domain capable of inhibiting a humoral immune response. Also included are a chimaeric DNA construct (comprising a DNA sequence encoding a domain capable of inhibiting a humoral immune response and a DNA sequence encoding a domain capable of inhibiting a humoral immune response), a condition a domain capable of inhibiting a humoral immune response), a cloning vector comprising the DNA construct, a host cell transformed by the vector, a transgenic cell, tissue, organ or mammal comprising the chimaeric protein, producing a mammal, mammalian organ, tissue or cells, where the mammal is useful as an organ donor for a human or organ, tissue or cells, where the protein defined above into the mammal, organ, tissue or cells, where the protein is expressed in the mammal, organ, tissue or cells, where the protein is expressed in the mammal, organ, tissue or cells, capions of the DNA appearing as ADA50036 which encodes the pig cTLA4 (cytotoxic T lymphocyte A4, also known as CDIS2) and defined regions of the portein ADA50037. The chimaeric protein is useful in the protection of the portein cell after xenotransplantation into a human, and in inhibiting humoral and cellular defence mechanism.

Chimaeras were produced comprising pig CTLA4 (cellular immune response region) and human CD59 (humoral response region), and of CTLA4 and human CD59 (contrarsor) and human CD59 chimaera
                                                                                                                                                                                     New chimeric proteins comprising a first domain and a second domain capabale of inhibiting a callular and humoral immune response, respectively, useful for regulating humoral and cellular effector functions of the immune system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 21; 59pp; English.

The protein and DNA molecules are useful in the prevention or treatment of humoral and cellular rejection of xenotransplants. In particular, the DNAs may be used to produce transpenic animals for use as tissue/organ donors, the cells of which are protected from human cellular immune responses due to their expression of
                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          the chimeric protein. The present sequence represents the amino acid sequence of a pig CTLA4-human CD59 chimeric protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New chimeric protein capable of inhibiting both cellular and humoral immune responses, and DNA constructs encoding the chimeric protein, useful for preventing and/or treating rejection of xenotransplants.
                                                                                                                                                                                                                                                                                                                  pig; CTLA4; human; CD59; immune response inhibitor; xenotransplant rejection; transgenic; tissue donor; organ donor.

The invention relates to a chimaeric protein comprising a first domain capable of inhibiting a cellular immune response and a second domain capable of inhibiting a humoral immune response. Also included are a chimaeric DNA construct (comprising a DNA sequence encoding a domain capable of inhibiting a humoral immune response, a chimaeric DNA construct, a host cell transformed by the vector, a transgenic cell, tissue, organ or mammal comprising the chimaeric protein, producing a mammal, mammalian organ, tissue or cells, where the mammal is useful as an organ donor for a human or organ, tissue or cells, where the mammal is useful as an organ donor for a human or organ, tissue or cells, where the protein is expressed in the mammal, organ, tissue or cells, where the protein is expressed in the mammal, organ, tissue or cells, chimaeric protein is expressed in the mammal, organ, tissue or cells, defined regions of the DNA appearing as ADAS0036 which encodes the pig critA4 (cytocoxic I lymphocyte A4, also known as CDIS2) and defined cregions of the protein ADAS0037. The chimaeric protein is useful in the protection of the porcine cell after xenotransplantation into a human, and in inhibiting humoral and cellular defence mechanism.

Chimaeras were produced comprising pig CTLA4 (cellular immune response region) and human CDS9 (humoral response region), and of CTLA4 and human CDS9 chimaera
                                                                                                           New chimeric proteins comprising a first domain and a second domain capable of inhibiting a cellular and humoral immune response, respectively, useful for regulating humoral and cellular effector functions of the immune system.
                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; Page 32-33; 59pp; English.

ö
the vector, a transgenic cell, tissue, organ or mammal comprising the chimaeric protein, producing a mammal, mammalian organ, tissue or cells, where the mammal is useful as an organ donor for a human or organ, tissue or cells, or cells transplant into a human, by inserting a nucleic acid encoding a chimaeric protein defined above into the mammal, organ, tissue or cells, where the protein is expressed in the mammal, organ, tissue or cells, defined regions of the DNA appearing as ADAS0036 which encodes the pig regions of the CTLA4 (cycloxic T lymphocyte A4, also known as CD152) and defined regions of the CTLA4 protein ADAS0037. The chimaeric protein is useful in the protection of the porcine cell after xenotransplantation into a human, and in inhibiting humoral and cellular defence mechanism. Chimaeras were produced comprising pig CTLA4 (cellular immune response region) and human CD59 (humoral response region), and of CTLA4 and human DAP (not defined). The present sequence represents a CTLA4/CD59 chimaera
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human; CDS9; complement inhibitor; gene; ds; complement receptor 2; CR2; chimeric; immunoconjugate; cancer; Hodgkin's lymphoma; myeloid leukaemia; hypoxic tumour; viral infection; inflammatory condition; rheumatoid arthritis; Crohn's disease; systemic lupus erythematosus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to novel targeted modulators of the complement receptor 2 (CR2) protein that is involved in regulating complement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

activity. Specifically, it refers to immunoconjugate compositions comprising a construct that has a complement inhibitor linked to the CR2, which can be used modulate the complement system i.e. the series of blood proteins that are major effectors of the immune system. The present invention describes compositions that can be used to treat various cancers including Hodgkin lymphoma, myeloid leukaemia and hypoxic tumours, viral infections such as herpes simplex virus, cytomegalovirus and Epstein-Barr virus, as well as inflammatory conditions for example Accordingly, these compositions exhibit cytostatic, antiathematosus. Accordingly, these compositions exhibit cytostatic, antiathematic, antiinflammatory, dermatological, immunosuppressive, antiathritic, antiinflammatory dermatological, immunosuppressive, antiathritic, antiinflammatory adraticities. This polypeptide sequence is the human CDS9-CR2 fusion protein (CDS9 is a complement inhibitor) of the

TITLE OF INVENTION: CONJUGATES OF SOLUBLE PEPTIDIC COMPOUNDS WITH
TITLE OP INVENTION: MEMBRANE-BINDING AGENTS
FILE REPREMENCE: 37945-0004
CURRENT APPLICATION NUMBER: US/10/742,887
CURRENT PILING DATE: 2003-12-23
PRIOR APPLICATION NUMBER: US/09/612,314
PRIOR FILING DATE: 2000-07-07
PRIOR FILING DATE: 1999-03-16
PRIOR FILING DATE: 1999-03-16
PRIOR PILING DATE: 1999-07-18
                                                                                                                                                                                                                                                                                                                                                                                                                                                         ; OTHER INFORMATION: Description of Artificial Sequence: Synthetic; OTHER INFORMATION: peptide
